

# Shaded Pole Motors

EM 21

Standard version:

- direction of rotation clockwise
- mounting position with horizontal shaft
- mode of operation S1
- sintered sleeve bearings with additional lubricant depot
- permissible ambient temperature 0 – 60° C.

# Brakes

B1 / B2

ebm-papst • Landshut

## Motor brake B1

The motor brake B1 is designed as a lifting magnet brake and can be adapted to EM30 and KM motors. It brakes without electricity by spring-force and is released under voltage together with the motor winding. The armature of the brake locks a cam disc, fixed on the motor shaft between two friction surfaces.

## Disc brake B2

This brake can be applied in connection with motors EM30 and KM, if higher brake torque and switching cycles are required. The brake works without electricity and with spring-force, but it is electromagnetically released. The brake is switched parallel to the motor winding. Construction according to VDE 0580.

## Alternating Current

### Technical Notes

As drive motors, external-rotor motors operate at constant speed and very low noise level. Their short and compact design is of further advantage. Due to their rather high inertia, external-rotor motors guarantee constant speeds at varying loads.

The motors listed here only serve as overview on our standard range of motors. Whenever necessary, the motor design may be adapted and optimised to meet individual customer specifications.

Motors for thermostats and beverage coolers come as closed design and have a shaft of stainless steel. All rotors are stove-enamelled in black.

There are also external-rotor motors available in electronically commutated (EC) motor design.

These motors have high efficiency and can, with regard to their electronics, be offered in various options. Connecting them to a 230 V AC power supply is one of these options.

### Performance Data

All performance data refer to open motors of protection class IP 00.

For IP 44, performance is lower by about 25 – 30 % in order not to exceed the maximum admissible temperature. This, however, does not apply if the motor is placed in the air stream of a fan. We gladly assist you in selecting the best type for your application and to optimise performance of the unit. Data on the temperature rise of the wiring was established in keeping with EN 60034-1.

### Speed Control

Their special motor characteristic makes external-rotor motors easily speed-controllable in relation to their loads by simply reducing the voltage. Depending on the application, fixed resistors and other, motor-integrated, controls can be used, such as speed graduation, autotransformer, capacitive resistor, electronic controls etc.

## Motor types

### S = Shaded-Pole Motor

Self-starting, comparatively low starting torque, low efficiency, limited range for speed control.

### E = Single-Phase Capacitor Motor

Comparatively high starting torque, good speed control properties resulting in less than optimum efficiency.

### D\* = Three-Phase Motor

Steinmetz configuration with capacitor, high pullout torque, steep torque / speed curve, high efficiency, high level of speed stability.

### D = Three-Phase Motor

Exceptionally high starting torque, very good efficiency, good speed control characteristic 400 V  $\Delta$  / Y version for two speed levels available on request.

### Torque characteristics

# External-rotor motor

for agitating machines, size 068

- Mounting flange in diecast aluminium
- Rotor stove-enamelled in black
- Shaft in stainless steel
- Maintenance-free ball bearings
- Direction of rotation clockwise, viewed on rotor
- Type of protection IP 44 when installed  
(final evaluation has to be carried out in customer's application)
- CE Approval

# External-rotor motor

## Drive motor, size 074

- Mounting flange in diecast aluminium
- Rotor stove-enamelled in black
- Shaft in roller bearing steel
- Maintenance-free ball bearings
- Direction of rotation either clockwise or counterclockwise rotation, viewed on rotor.
- Type of protection IP 00
- CE Approval

ebm-papst • Mulfingen
